EMERSA

KRUPIQ

Your systems stop being the thing worth breaking into

Emersa Labs

August 2026

The problem you already have

Every time you block it, you teach it something.

A refusal tells the other end that route is shut, so it tries the next one. Thousands of times an hour, learning your edges as it goes.

EMERSA

What Changed

The techniques are old. The pace is not

Faster

Twenty nine minutes from the way in to moving sideways.

The fastest seen was twenty seven seconds.

More

Eighty nine percent more attacks using AI in a year.

Same methods, far more of them.

Patient

One intrusion ran for four and a half days.

It never tired and never gave up.

Your people are being asked to outpace something that does not sleep.

The opening

They see the trap.
They walk into it anyway.

Seventy three percent of tested systems, having named it a trap themselves.

That gap is the one thing a defender has been handed in years.

EMERSA

How It Works

Three steps, and only the first one refuses anything

01

Flood

Bulk traffic is turned away before it costs you anything.

The only place we say no.

02

Bait

Files and logins nothing legitimate ever touches.

One of them being opened is all the signal we need.

03

Move

The connection succeeds, into a copy of your service.

Your real systems are never on the path.

From the far end it looks like an ordinary, healthy service.

EMERSA

What Is Underneath

Six parts, each with one job

Cat
floods

Owl
watching

Squid
moving

Chimera
deciding

Governor
cost

Auditor
record

Nothing waits on the network to decide. Every machine decides for itself.

EMERSA

The Same Ten Minutes

What they see

A service that answered.

A login that worked.

Files worth taking.

A job finished.

What happened

Nothing real was opened.

Every move was recorded.

They paid for the time.

You got the full account.

EMERSA

What It Is Built To Handle

Something automated gets in	• It is given a convincing success instead of a refusal
Bulk traffic floods you	• Turned away before it costs you anything
Ransomware starts encrypting	• Bait files are touched first, and that is the alarm
Something nobody has seen before	• Caught after it connects, and kept away from anything real
Small devices you cannot protect	• Watched at the gateway instead of on the device

EMERSA

What You Can Show Afterwards

The part auditors and boards actually ask for

Signed

Every decision recorded in order, and impossible to quietly change.

Two people

A permanent block needs two named operators, not one.

Loud

Nothing fails quietly. If a part degrades, you are told.

Ready to send

One report, straight out of the record.

NIST CSF MITRE ATT and CK CWE and CVE SOC 2 Type II ISO 27001 PCI DSS HIPAA

EMERSA

Built In This Order

Because each part depends on the one before it

Timings are set once the first stage tells us how fast we really go.

EMERSA

Let them think they are inside.
Then find out everything.
